

Boolean Logic

Will Leeson

What comes to mind
when you think of
“Logic”?

Boolean Logic

- Developed by George Boole in 1854
- A systematic approach to logic
- Two Values
 - True (1)
 - False (0)
- Variables
- Three “Basic” operators
- Several “Secondary” Operators

| X | Y | $X \oplus Y$ |
|---|---|--------------|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | T |

Some Terminology

- Constant
 - A value that does not change
 - In algebra: 1, -30, 2.541, π
 - In boolean logic: True, False
- Variable
 - A value that can span many values
 - Usually represented by a single letter (x, y, z, etc.)
 - Same for both algebra and boolean logic

Some Terminology

- Operator
 - A symbol representing a set function
 - Unary and Binary operators
 - In algebra: $+$, $-$, $/$, $^$, etc.
 - In boolean logic: \wedge , \vee , \leftrightarrow , \neg
- Operand
 - The values an operator acts on
 - Algebra: $\mathbf{1 + 3}$, $\mathbf{27 / x}$, $\mathbf{-3}$, etc.
 - Boolean logic: $\mathbf{True \wedge False}$, $\mathbf{X \leftrightarrow Y}$, $\mathbf{\neg X}$
- Expression
 - A combination of operators and operands
 - Follows rules according to the mathematical language

Conjunction

- Binary Operator
- In words - and
- In symbols - \wedge
- Only true if both expressions are true
 - “Did you go to dinner **and** a movie.”
 - “If you are happy **and** you know it, clap your hands”

| X | Y | $X \wedge Y$ |
|---|---|--------------|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | F |

Disjunction

- Binary Operator
- In words - or
- In symbols - \vee
- True when either expression is true
 - “My friends must enjoy listening to Folk **or** R&B music”
 - “Are there shellfish **or** cheese in this dish? I’m deathly allergic.”

| X | Y | $X \vee Y$ |
|---|---|------------|
| T | T | T |
| T | F | T |
| F | T | T |
| F | F | F |

Negation

- Unary Operator
- In words - not
- In symbols - \neg
- True when the expression is False
 - “I am **not** 30 years old.”
 - “They are **not** a fan of the New York Jets.”

| X | $\neg X$ |
|---|----------|
| T | F |
| F | T |

Conditional

- Binary Operator
- In words - If X then Y
- In symbols - \rightarrow
- True unless X is true and Y is false
 - “If I’ve been to Pluto, **then** I’ve been to Mars.”
 - “If I’ve seen a cute dog, **then** I’ve said out loud ‘Ooo, cute dog’”

| X | Y | $X \rightarrow Y$ |
|---|---|-------------------|
| T | T | T |
| T | F | F |
| F | T | T |
| F | F | T |

Biconditional

- Binary Operator
- In words - X if and only if Y
- In symbols - \leftrightarrow
- True if X equals Y
 - “Johnny can have dessert **if and only if** I did all of my homework”
 - “I will go to the concert **if and only if** I know the band that is playing.”

| X | Y | $X \leftrightarrow Y$ |
|---|---|-----------------------|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | T |

Exclusive Disjunction

- Binary Operator
- In words - (exclusive) or
- In symbols - \oplus
- True if either X or Y is true, not both
 - “Would you like the chicken **or** the fish?”
 - “I need to take my pill **or** the lactose in the pizza will be a problem.”

| X | Y | $X \oplus Y$ |
|---|---|--------------|
| T | T | F |
| T | F | T |
| F | T | T |
| F | F | F |

Order of operation

- In algebra, PEMDAS
 - Parentheses
 - Exponent
 - Multiplication/Division
 - Addition/Subtraction
- In boolean logic, IPAOEBC
 - Inverse (Not)/Parentheses
 - And
 - Or/EXOR
 - Biconditional/Conditional

Truth Tables

- A way to structure Boolean Formula
 - Break down the formula into “atoms”
 - Define the atoms using True and False
 - Combine atoms using order of operations
 - Repeat until none are left

| X | Y | $X \rightarrow Y$ |
|---|---|-------------------|
| T | T | T |
| T | F | F |
| F | T | T |
| F | F | T |

Truth Tables

$$(X \vee Y) \wedge \neg X$$

| X | Y | $(X \vee Y)$ | $\neg X$ | $(X \vee Y) \wedge \neg X$ |
|---|---|--------------|----------|----------------------------|
| T | T | T | F | F |
| T | F | T | F | F |
| F | T | T | T | T |
| F | F | F | T | F |

Truth Tables

$$(A \rightarrow B) \vee (B \rightarrow A)$$

| A | B | $(A \rightarrow B)$ | $(B \rightarrow A)$ | $(A \rightarrow B) \vee (B \rightarrow A)$ |
|---|---|---------------------|---------------------|--|
| T | T | T | T | T |
| T | F | F | T | T |
| F | T | T | F | T |
| F | F | T | T | T |

Tautology!

Truth Tables

$$(X \vee Y) \wedge \neg(X \vee Y)$$

| X | Y | $(X \vee Y)$ | $\neg(X \vee Y)$ | $(X \vee Y) \wedge \neg(X \vee Y)$ |
|---|---|--------------|------------------|------------------------------------|
| T | T | T | F | F |
| T | F | T | F | F |
| F | T | T | F | F |
| F | F | F | T | F |

Contradiction!

Truth Tables

$$X \wedge Y \leftrightarrow Z \vee Y$$

| X | Y | Z | $X \wedge Y$ | $Z \vee Y$ | $X \wedge Y \leftrightarrow Z \vee Y$ |
|---|---|---|--------------|------------|---------------------------------------|
| T | T | T | T | T | T |
| T | T | F | T | T | T |
| T | F | T | F | T | F |
| T | F | F | F | F | T |
| F | T | T | F | T | F |
| F | T | F | F | T | F |
| F | F | T | F | T | F |
| F | F | F | F | F | T |

Logical Equivalence

| X | Y | $X \rightarrow Y$ |
|---|---|-------------------|
| T | T | T |
| T | F | F |
| F | T | T |
| F | F | T |

\equiv

| X | Y | $\neg X$ | $\neg X \vee Y$ |
|---|---|----------|-----------------|
| T | T | F | T |
| T | F | F | F |
| F | T | T | T |
| F | F | T | T |

Logical Equivalence

| X | Y | $X \leftrightarrow Y$ |
|---|---|-----------------------|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | T |

≡

| X | Y | $(X \wedge Y) \vee (\neg X \wedge \neg Y)$ |
|---|---|--|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | T |

Logical Equivalence

| X | Y | $X \oplus Y$ |
|---|---|--------------|
| T | T | F |
| T | F | T |
| F | T | T |
| F | F | F |

≡

| X | Y | $(X \vee Y) \wedge \neg(X \wedge Y)$ |
|---|---|--------------------------------------|
| T | T | T |
| T | F | F |
| F | T | F |
| F | F | T |

So what does this
have to do with
Computers?

Computers are machines

- They do not think for themselves
- They follow a set of instructions
 - Can be informed by external stimulus
 - Can be informed by “randomness”
- Programs rarely don’t make “decisions”
 - If they clicked button X, do Y
 - If X and Y or Z, do A
- When writing programs, you will use boolean logic

Computers are machines

- Computers are wires with electricity running through them
- They don't know what $X+Y$ means
 - We must translate $X+Y$ to electricity
 - This is where Boolean Algebra comes in
- Different “gates” enact boolean operations
- Circuits are combinations of gates serving different purposes

Gate diagrams

AND Gate

OR Gate

NOT Gate

NAND Gate

NOR Gate

XOR Gate

Addition Circuit

In decimal: $1 + 0 = 1$

In binary: $1 + 0 = 1$

In logic: $S = 1 \oplus 0 = 1$
 $C = 1 \wedge 0 = 0$

In decimal: $1 + 1 = 2$

In binary: $1 + 1 = 10$

In logic: $S = 1 \oplus 1 = 0$
 $C = 1 \wedge 1 = 1$

And we can go on from there...

MULTIPLE
